

WEEK 3

FINANCIAL DATA IMPORT, TRANSFORMATION & TIME INTELLIGENCE

1. Data Import / Power Query

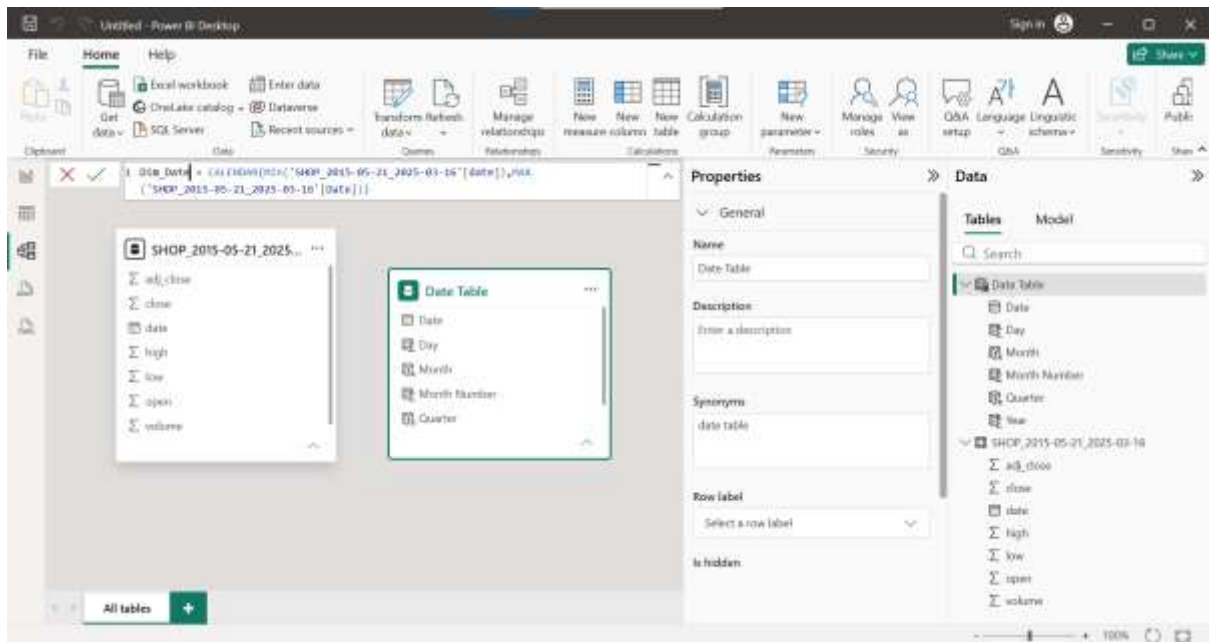

The Shopify stock market dataset was imported into Power BI using Power Query. The data contains financial information required for analyzing stock price movements, trading volume, and other market-related trends.

Imported Shopify stock market data prepared for financial analysis.

2. Dim_Date Table

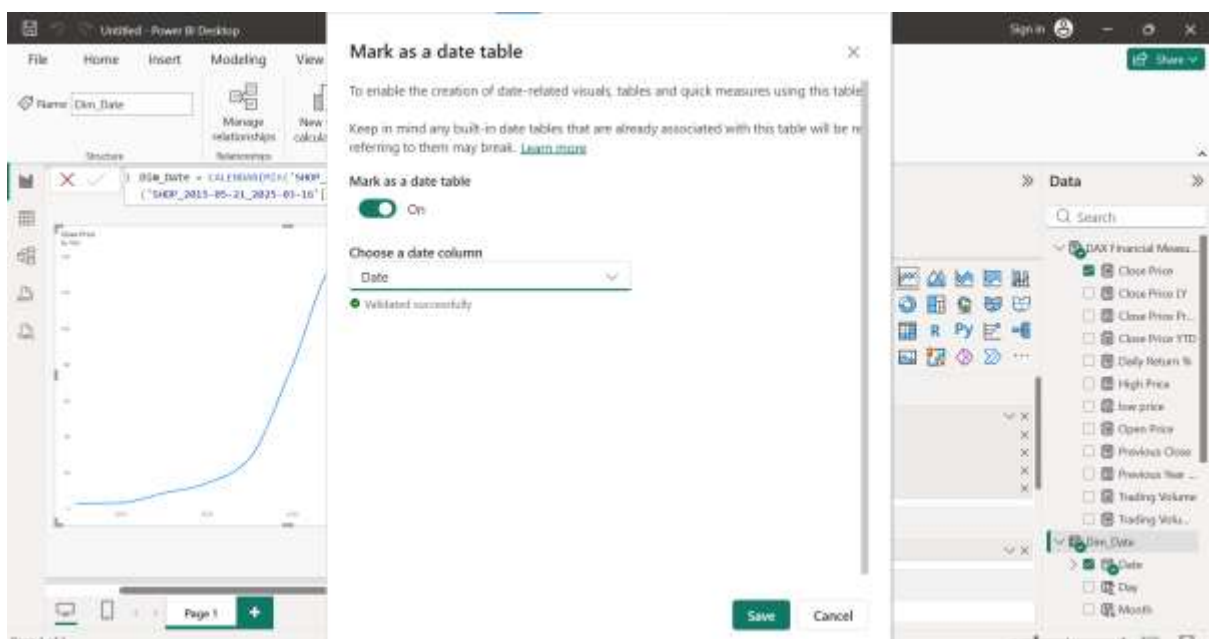

The Dim_Date table was created to organize date-related information such as Date, Day, Month, Quarter, and Year. It helps in performing time-based analysis and makes it easier to compare financial data across different time periods.

Created a dedicated date dimension for time-based financial analysis.

3. Date Table Marking

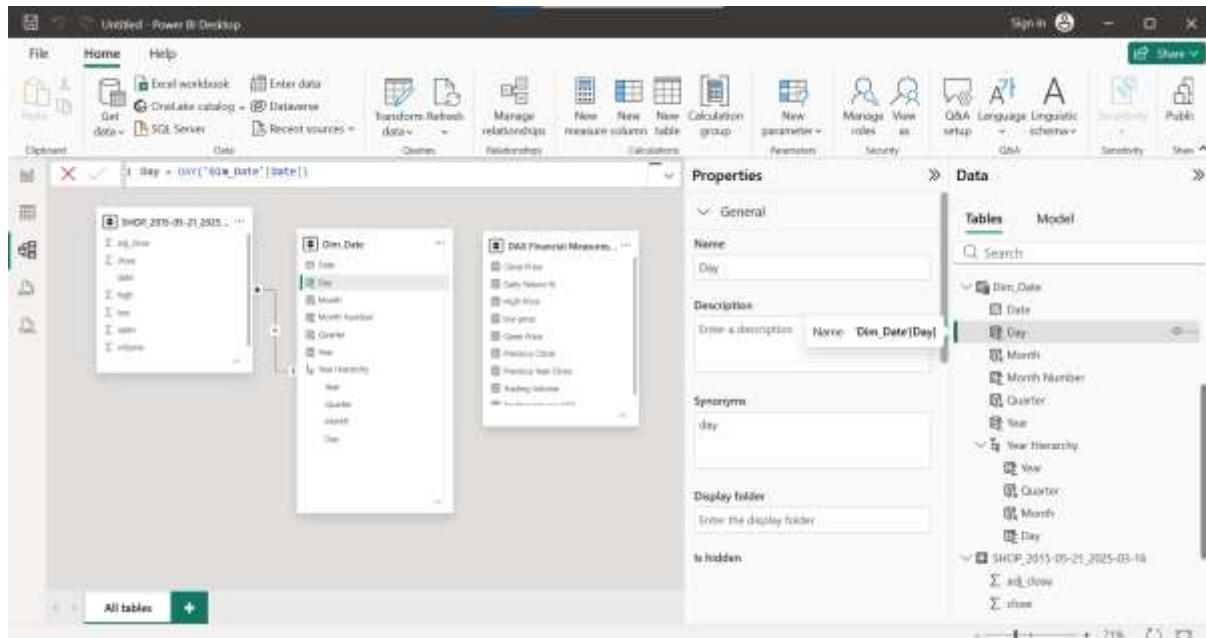

The Dim_Date table was marked as the official Date Table in Power BI. This ensures that the date column is correctly recognized and supports accurate time-intelligence calculations and date-based analysis.

Marked Dim_Date as the official Date Table in Power BI.

4. Date Hierarchy

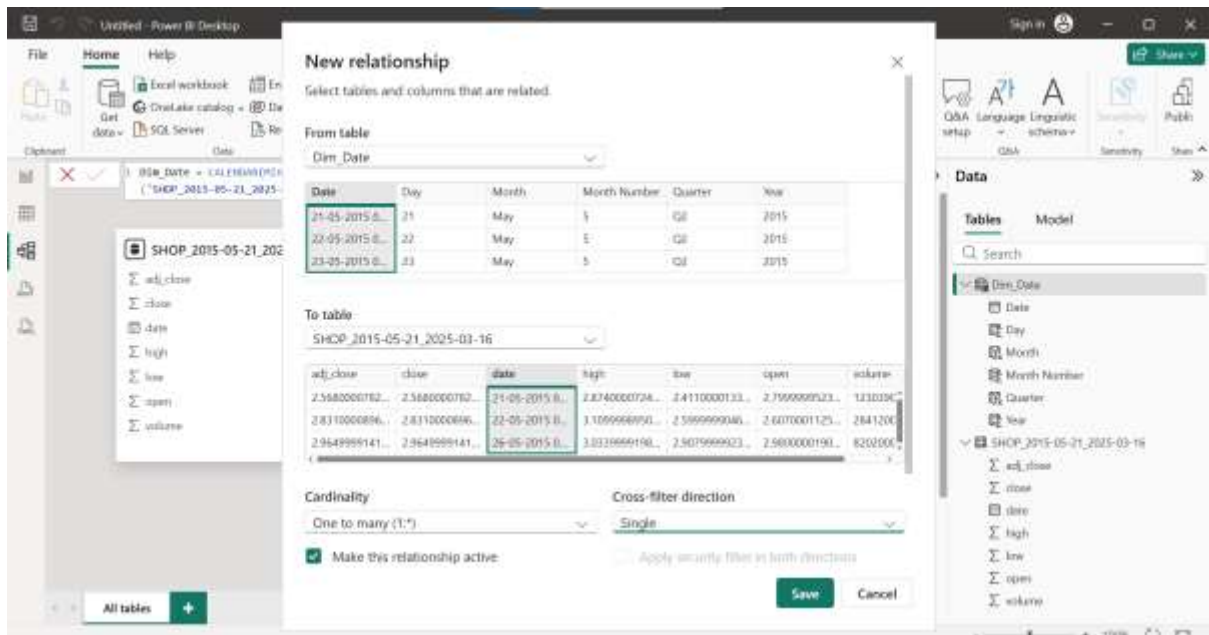

A date hierarchy was created using Year, Quarter, Month, and Day levels. This hierarchy allows the financial data to be explored at different time levels using the drill-down feature in Power BI.

Created a Year–Quarter–Month–Day hierarchy for drill-down analysis.

5. Model / Relationship

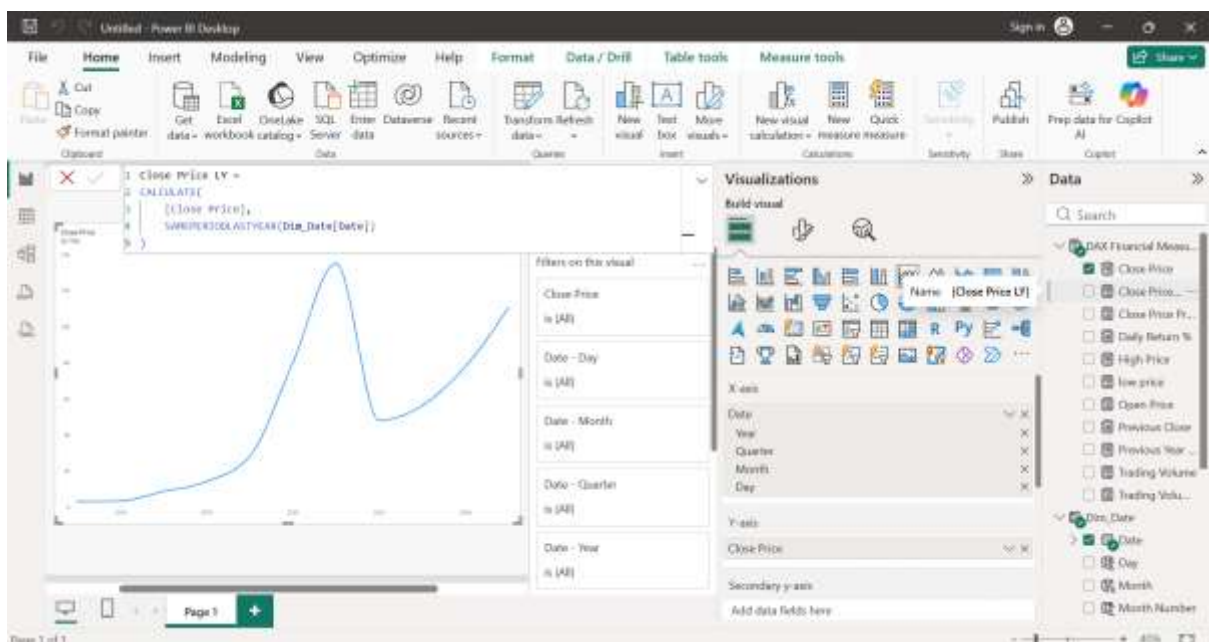

An active one-to-many relationship was established between the Dim_Date table and the stock data table. This relationship connects the date information with the financial data and enables accurate date-based analysis and time-intelligence calculations.

Established an active one-to-many relationship between the date dimension and stock data.

6. Close Price Chart

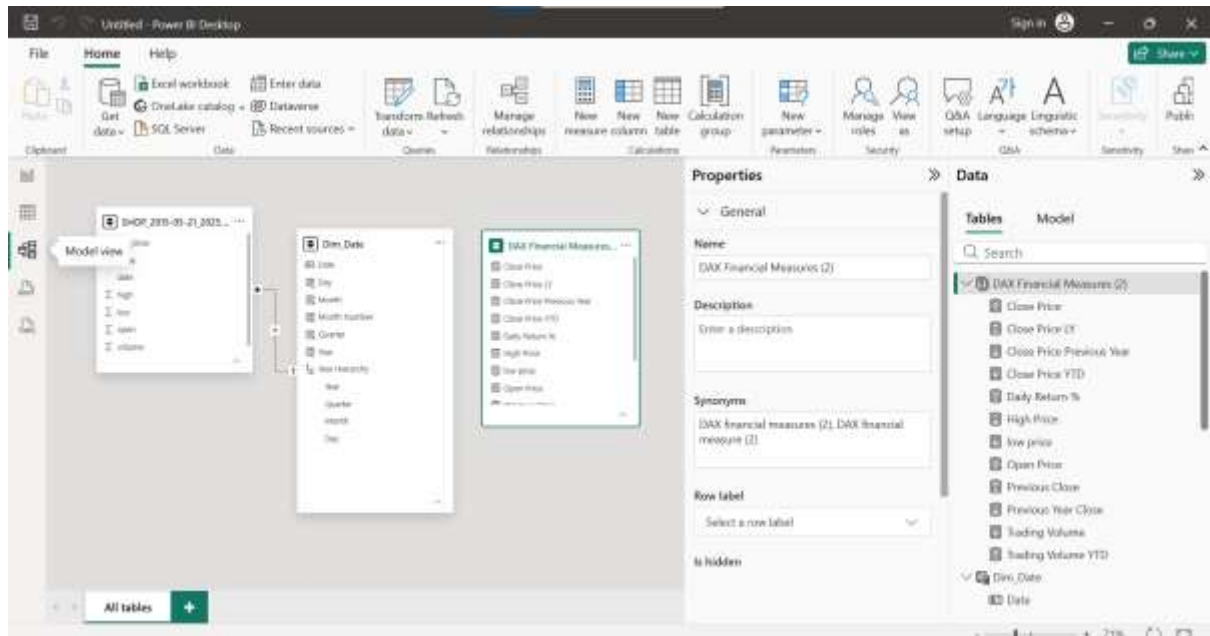

A line chart was created to display the stock closing price over time. This visualization helps to observe changes and trends in the closing price across different dates.

Visualized stock closing price movements over time.

7. Time Intelligence Measures

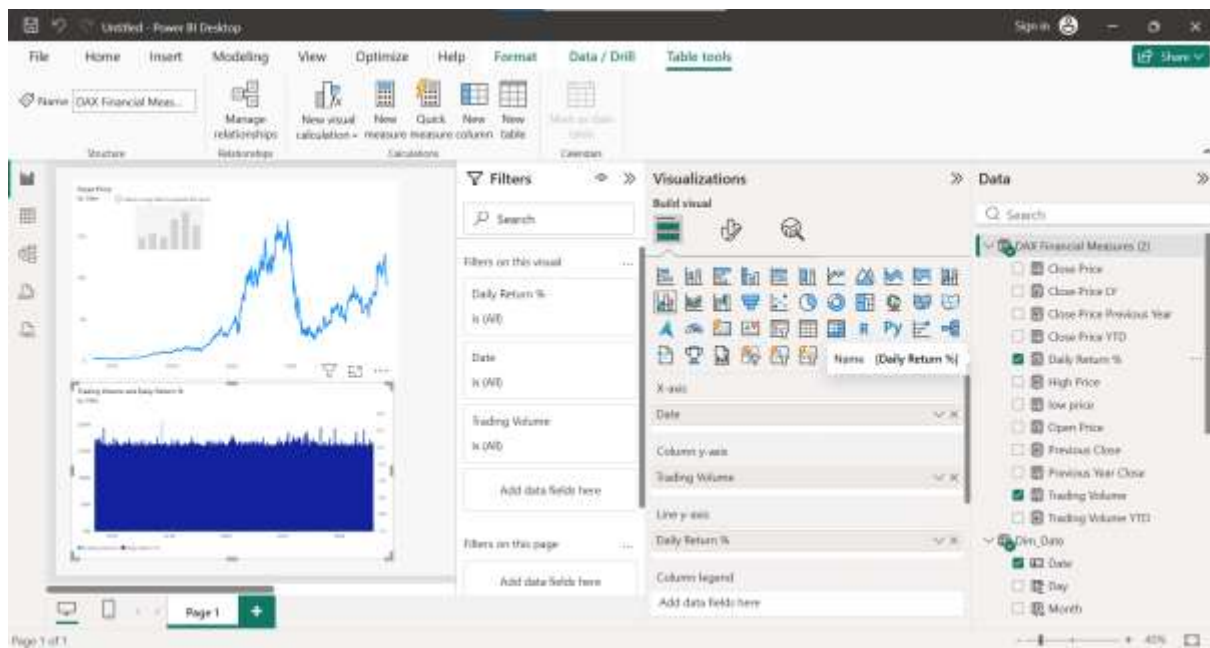

DAX time-intelligence measures were created to analyze financial data across different time periods. These measures calculate previous-year values and year-to-date values for close price and trading volume.

Created DAX time-intelligence measures for year-over-year and year-to-date analysis.

8. Trading Volume + Daily Return %

DAX time-intelligence measures were created to analyze financial data across different time periods. These measures calculate previous-year and year-to-date values for close price and trading volume, supporting effective time-based financial analysis.

Compared trading volume and daily return percentage over time.
